

Try to find angle A

$$a/\sin A = b/\sin B$$

OR

$$\sin A/a = \sin B/b$$

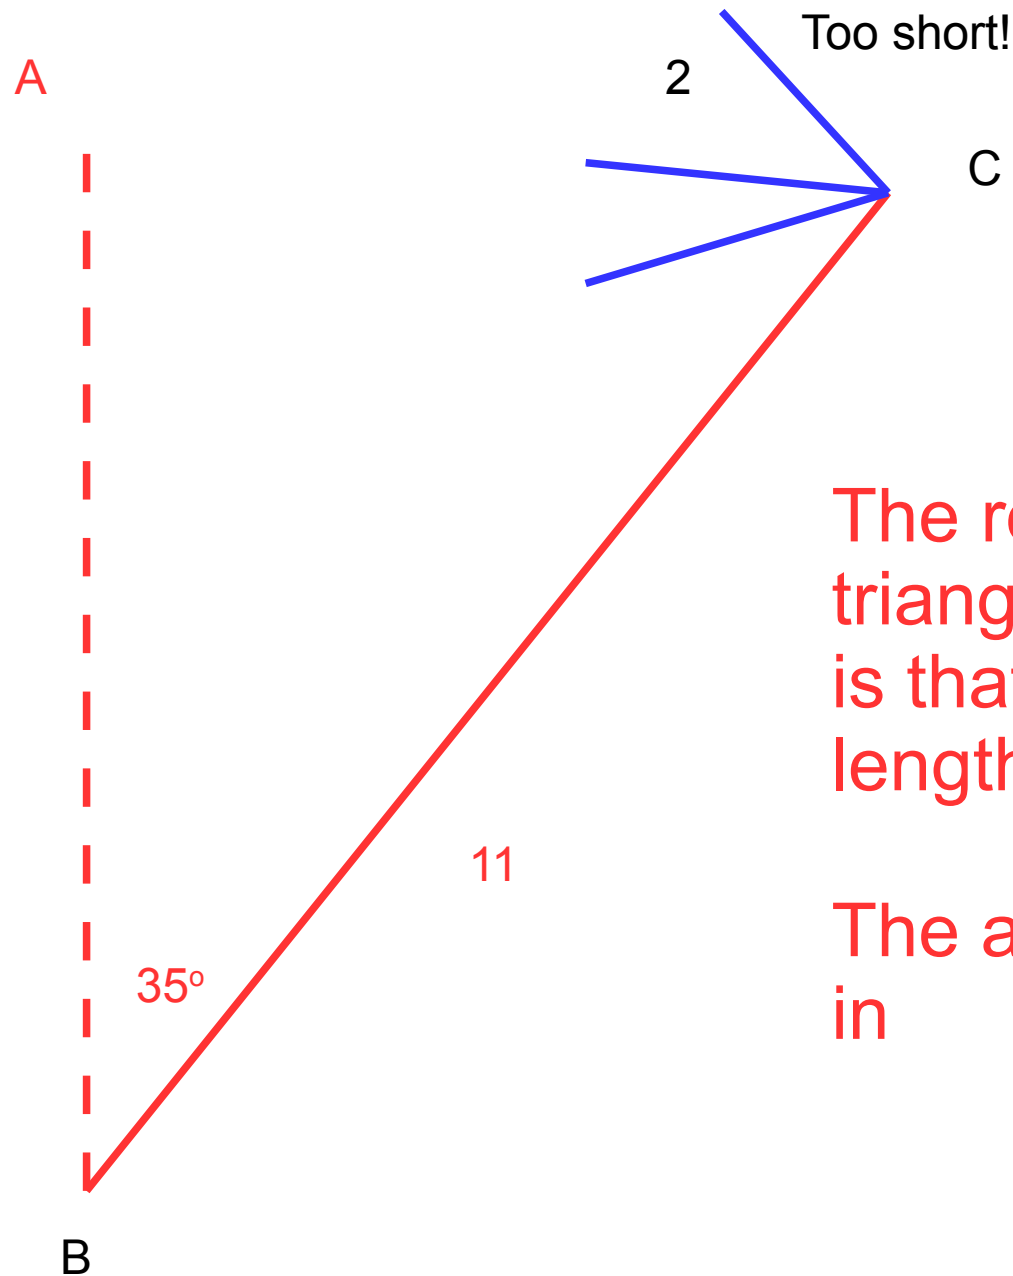

$$\sin A / 11 = \sin 35 / 2$$

$$\sin A = (\sin 35 / 2) \times 11$$

$$\sin A = 3.15$$

This will give us an ERROR because The most a sine Relationship can be is 1.0 (the OPP is 100% of the HYP)

The reason this triangle doesn't work is that the side with length 2 is too short

The angle 35° is locked in

Consider the following triangle:

What is angle C?

Since we have this relationship (OPP)
We can use SINE law

C

$$\begin{aligned}\sin A / a &= \sin C / c \\ \sin(30) / 8 &= \sin C / 10 \\ 0.0625 &= \sin C / 10 \\ 0.0625(10) &= \sin C \\ 0.625 &= \sin C \\ C &= \sin^{-1}(0.625) \\ C &= 38.6^\circ\end{aligned}$$

BUT! (the ambiguous case)
-- consider the same triangle

What is angle C?

There is ANOTHER
Possible triangle with
the same side c
and angle A locked in

What changes is the
angle C and B

This second triangle
is called the AMBIGUOUS
case

Question: How do we find the second triangle?

What is angle C?

-- the calculator just gave us ONE answer (38.6°).

-- how do we find the other Angle?

$180 - 38.6 =$ the other possible angle for C

The other angle for C is 141.4°

Consider the following triangle:
-- Find both possibilities for angle C

$$\begin{aligned}\sin C / 13 &= \sin(25) / 9 \\ \sin C &= 13 \times \sin(25) / 9 \\ \sin C &= 0.610\end{aligned}$$

$$C = 37.6^\circ$$

Consider the following triangle:
-- The second triangle

$$\text{New } C = 180 - 37.6^\circ = 142.4^\circ$$

There is NOT always an ambiguous case
When?

When the green
line is TOO long
(longer than 13)
